Did **you** know...

Your gut can affect the way you feel and how often you get sick?

Improving GI Health
will make reaching your health goals easier.

The systems in your body, including your nervous, immune, endocrine, and gastrointestinal (GI) systems, are interconnected and dependent on the others to function properly. For instance, the GI tract absorbs nutrients required by other systems to function, and it is the second largest organ in the immune system (after the skin). Therefore, when the GI system is not functioning properly, a variety of health issues occur.

Causes of Poor GI Health

Poor GI health is the result of the constant stress found in modern life. Emotional issues, stressful lifestyle, poor diet, repeated illness, or exposure to toxins can all cause the breakdown of the intestinal layers that absorb nutrients and prevent harmful substances from entering the bloodstream.

Addressing GI Health to Advance Your Health Goals

Maintaining the health of your GI tract is an important part of any healthcare protocol. By addressing GI health, you directly support a healthier brain - body - gut connection. This is important when suffering from a complex/persistent condition or simply striving for optimal health.

Importance of Intestinal Health

Your intestines are tasked with the difficult job of absorbing nutrients from foods, while at the same time preventing unwanted molecules (toxins, undigested foods, bacteria, viruses, and fungi) from entering your body.

The intestines accomplish these tasks by using three protective barriers or layers.

- **Epithelial layer:** is the cell layer that is traditionally thought of as the intestinal wall. It allows nutrients to pass through while preventing harmful substances from entering your body.
- **Mucosal layer:** covers the epithelial layer, protecting it from stomach acid and providing nutrients for the third layer.
- **Microbiota layer:** consists of beneficial microbes that digest food into the nutrients you need and prevent harmful bacteria from settling into your intestines.

Any successful GI nutritional program must address these intestinal layers as a cornerstone to improving GI health and your overall health. The three R's of GI repair focus on restoring and maintaining the health of these layers while addressing the over-active immune response associated with poor GI health.

The Three R's of GI Repair

- **Repair:** The GI (intestinal and stomach) barriers are rebuilt to help restore proper GI function.
- **Reset:** The overactive immune response is calmed to prevent breakdown of the repaired GI barrier.
- **Recolonize:** The natural balance of beneficial microbes (microbiota) is restored to the GI tract to protect the repaired GI barriers, prevent swelling, and support a healthy immune system.
